Geography Revision Practice

Unit: Our Restless Earth (Unit Test: Monday 12 Oct)

Read the question carefully. Answer in full sentences where asked.

Part A - Earth's Structure

Q1. Name the four main layers of the Earth, from the outside to the centre.

Q2. Which layer is the thinnest? Is it solid or liquid?

Q3. The Earth's crust is broken into large pieces. What are these pieces called?

Q4. Name the two types of crust. Which one is thicker?

Part B - Plate Boundaries

Q5. At a CONSTRUCTIVE (divergent) plate boundary, do plates move towards or away from each other? What landform is created?

Q6. At a DESTRUCTIVE (convergent) plate boundary, what happens when an oceanic plate meets a continental plate? Use the words: subduction, magma.

Q7. Plates slide past each other at a _____ plate boundary. Give one famous example of this type of boundary.

Part C - Earthquakes

Q8. What is the difference between the FOCUS and the EPICENTRE of an earthquake?

Q9. Which instrument measures earthquakes, and which scale measures their strength?

Q10. State TWO ways people can prepare for an earthquake.

Part D - Volcanoes

Q11. Label the parts of a volcano on the diagram (draw and label): magma chamber, main vent, crater, lava flow.

Q12. Explain the difference between an ACTIVE, a DORMANT and an EXTINCT volcano. Give one example of each.

Part E - Fold Mountains & Data

Q13. How are fold mountains formed? Name one range of fold mountains in the world.

Q14. Look at the pie chart on p.18 Task 2(b) of your test booklet. (a) Which sector is the largest? (b) What percentage does the smallest sector show? (c) Write two sentences describing what the chart shows.

Revision tip: re-read textbook pp.3-17 and PPTs (0, 1, 2a, 2b, 3) before doing this paper again.

Answer Key (for Dad only)

A1. Crust, mantle, outer core, inner core.

A2. The crust is the thinnest layer. It is solid.

A3. They are called tectonic plates.

A4. Oceanic crust and continental crust. Continental crust is thicker.

A5. Away from each other. New crust / mid-ocean ridges / rift valleys are created.

A6. The denser oceanic plate sinks (subduction) under the continental plate; friction melts rock to form magma, which may rise and cause volcanoes and earthquakes.

A7. Conservative (transform) boundary. Example: the San Andreas Fault (California).

A8. The focus is the point INSIDE the Earth where the earthquake starts; the epicentre is the point on the Earth's SURFACE directly above the focus.

A9. A seismograph (seismometer); the Richter scale (or moment magnitude scale).

A10. Any two: practise earthquake drills; secure heavy furniture; prepare an emergency kit; know safe spots (under a sturdy table); plan family meeting points.

A11. Magma chamber (bottom), main vent (middle pipe), crater (top opening), lava flow (down the side).

A12. Active = erupting now or recently (e.g. Mount Etna); dormant = asleep but could erupt again (e.g. Mount Fuji); extinct = not expected to erupt again (e.g. Ben Nevis).

A13. Formed when two plates push together (convergent boundary), folding the rock layers upwards. Example: the Himalayas, the Alps, the Andes.

A14. Answers depend on the p.18 pie chart in the test booklet; check the largest sector, smallest sector percentage, and write two description sentences.
